- ▶ Visible Light Communications (VLC) have been proposed as a technology to replace or augment existing RF wireless communications.
- ▶ Silicon Photomultipliers (SiPMs) have been proposed as a means of improving the SNR of VLC links¹.
- ▶ SiPMs can detect individual photons, however doing so creates a nonlinear response.
- ▶ This nonlinearity is worsened by the introduction of ambient light.

W. Matthews, et al. A 3.45 Gigabits/s SiPM-Based OOK VLC Receiver. in IEEE Photonics Technology Letters, vol. 33, no. 10, Institute of Electrical and Electronics Engineers, 2021, pp. 48790.

Silicon Photomultipliers

What is a SiPM?

- ▶ SiPMs are made of an array of microcells.
- ▶ A microcell is an avalanche photodiode (APD), with a quench circuit.
- ▶ Applications in LIDAR, time of flight PET, lifetime fluorescence spectroscopy as well as astrophysics and high energy physics.

J-30020 SiPM on
a SMTPA
evaluation board

- ▶ SiPMs are count rate limited.
- ▶ The device becomes saturated when the microcells are unable to recharge before the next photon arrives.
- ▶ Onsemi J-30020 SiPMs were characterised.
- ▶ J-Series SiPMs shown to not be paralyzable.

SiPM saturation curve for two different overvoltages

Data Transmission Results

SiPMs as OWC Receivers

- ▶ A world-record data rate of 3.45 Gbps was achieved using a SiPM receiver.
- ▶ Limited by the count rate of the SiPM.
- ▶ Impact of ambient light was investigated.

Data rate as a function of irradiance with no ambient light

Data Transmission Results

Transmitter penalty versus background irradiance

SiPM transmitter requirements
were characterised

(A) 1 Gbps, $L_{\text{total}} = 6\text{mWm}^{-2}$

(B) 1 Gbps, $L_{\text{total}} = 470\text{mWm}^{-2}$

New ISI

A new form of Inter-Symbol Interference

SiPM fast output showing typical response

SiPM fast output showing new ISI

Simulation of SiPMs

The first fully experimentally validated SiPM simulation

- ▶ A Monte Carlo model was developed to simulate SiPMs.
- ▶ The model was validated against experimental data.
- ▶ Predicted saturation, and data link performance.
- ▶ Available as free open source software.

$3V_{\text{over}}$ simulated SiPM saturation curve, using time domain model

SiPM Saturated Response

Device saturation and Effective PDE

- ▶ ePDE model:

$$\eta_{\text{eff}} \approx \frac{E_p I_{\text{bias}}}{Q_{\text{cell}} A_{\text{SiPM}} \cdot (L + L_{\text{dark}})}$$

- ▶ A 20dB/decade rolloff was measured in η_{eff} , however the mean cell Photon Detection Efficiency (PDE) rolled off at 10dB/decade.
- ▶ Rather than being count rate limited, the gain per photon decreases, also at 10dB/decade.

Effective PDE simulation vs measurement

- ▶ Novel method for selecting small FoV over a wide FoR.
- ▶ Solid state design.
- ▶ A high-resolution LCD aperture is used to select the FoV.

FoVSD Diagram

- ▶ Shown to be effective in rejecting:
 - ▶ Lambertian light sources.
 - ▶ Point sources.
 - ▶ Unwanted transmitters.
- ▶ Tested in a range of lighting conditions, including daylight.
- ▶ Solves the problem of multiple transmitters in VLC systems.

Selected point source vs angle

1. **Publications:** 13 papers published, 3 in preparation, and 3 conferences attended.
2. **Record Achievement:** Achieved a world-record OOK data rate of 3.45 Gbps using a SiPM receiver.
3. **New ISI:** Documented a new form of ISI in SiPMs and explained its origin.
4. **Nonlinearity Study:** Characterised nonlinearity and developed a model to predict effective PDE.
5. **Simulation:** Created a Monte Carlo model for SiPM, aiding in performance prediction for communication systems.
6. **Field of View Control:** Developed a novel method for selecting transmitters.

- ▶ The experimental setup was tested with OFDM, *with no ambient light*.
- ▶ OFDM has high peak powers and is sensitive to nonlinear characteristics².
- ▶ Despite increasing transmitter power, the data rate saturates.

SiPM Bias current against 405nm Irradiance
